TIMBER FROM POLAND™

TIMBER FROM POLAND™ is a purchasing office located in Poland consisting of a multilingual team, offering a range of solutions and products for construction, decoration and outdoor/indoor living space. Our products are designed for material traders. Our advanced experience in this sector and our flexible structure allow us to answer accurately your questions and fulfil your expectations. We guarantee you a good partnership. We are at your disposal to supply you with any kind of products. Simply contact us and get a speedy reply to any queries you might have!

Our added value

FSC® (Forest Stewardship Council) rules on forest management are strict, as are FSC®'s social and environmental requirements. The Council's principles and criteria describe management rules to follow so that the forests meet social, economic, ecological, cultural and spiritual needs of the present and future generations. They include both management constraints and social and environmental requirements. We know from experience that customers use various benchmarks and certificates to ensure quality and sustainability of the products they purchase.

To meet those requirements, we have established a management, order tracking and delivery process certification. This certification ensures the successful completion of the procurement process in our direct context. This unique certification process is the result of our long reflections, exchange of experiences and continuous development of key resources at sawmills we represent, and is comprehensively applied in all orders we deliver. Our principles are based on a dialogue and a clear, systematic documentary exchange so as to ensure that all stakeholders have the right information in order to keep the deadlines and ensure agreed-upon quantities and prices.

Our commitment to quality

TIMBER FROM POLAND™ does not guarantee the evolution of the wood color, or the rate of shrinkage, cracking or deformation related to the evolution of the material over time. We offer up to 10-year guarantee for our autoclave-treated wood, depending on the type of use. In the guarantee period, we replace free of charge any product attacked by fungi or insects.

This warranty applies to the product but does not cover workmanship. It applies to non-cut and non-machined wood. In all other cases, the guarantee covers cut or machined wood that was reprocessed by brushing or treated with a complementary treatment agent. These requirements must be complied with for our guarantee to apply.

DIVERSE PRODUCTS

OUR WOOD SPECIES

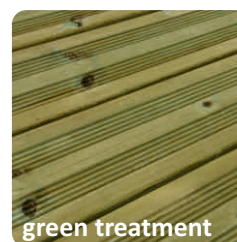

Scots pine: Pinus sylvestris, quality A/B

Treatment: autoclave^(*) class 4, green or brown certified

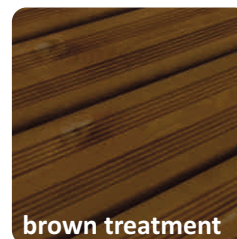

Characteristics: FSC label

Autoclave treatment: Class 4 treatment protects wood from insects, rot and fungi

Our products are packaged with slats between each row: the space so created allows a homogeneous distribution of the impregnation and guarantees a significantly increased longer service life. The use of a dry plank avoids excessive warping.

green treatment

brown treatment

Larch from Poland: Larix decidua or European larch, quality A/B

Treatment: 20% moisture content, anti-blue treatment

Characteristics: FSC label

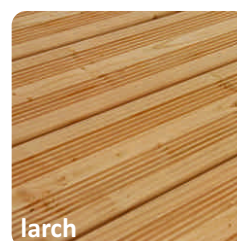

Advantages:

The advantages of larch are numerous:

- beautiful appearance, with colorful hues (yellow, orange and brown)
- high resistance to shocks and wear
- high resistance to cold
- high resistance to rain, it hardens with time in contact with water
- great durability
- the wood is almost rot-proof because of its density, it resists fire as well
- simple maintenance and easy installation

Advice:

The cleaning of this product is very easy. Simply use water and a little bit of soap to bring back the radiance of your terrace and cladding. You can also stain this wood species as it is not acidic.

larch

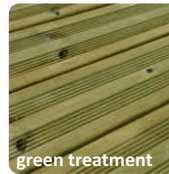

(*) autoclave treatment: see page 24

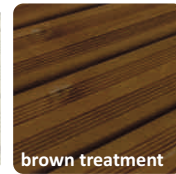

TERRACE DECKING

Dimensions:

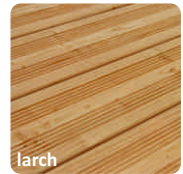

19mm x 95mm, length from 2m to 5m
 21mm x 98mm, length from 2m to 5m
 21mm x 120mm, length from 2m to 5m
 21mm x 145mm, length from 2m to 5m
 27mm x 145mm, length from 2m to 5m
 27mm x 155mm, length from 2m to 5m (Z profile)
 27mm x 165mm, length from 2m to 5m (XXL profile)

green treatment

brown treatment

larch

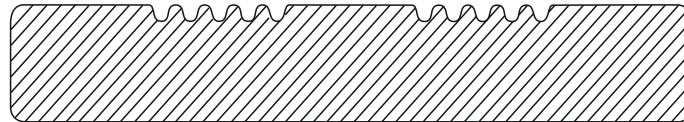

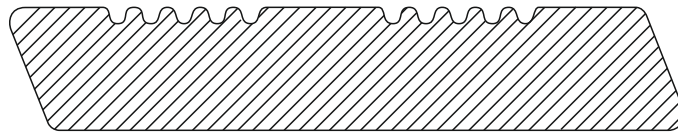

Various finishes available: anti-slip on 1 or 2 faces. Other dimensions on request.

Packaging:

104 pcs/pack

Application:

Pine and larch terrace decks are laid on class 4 pine beams or rafters. The boards are screwed with special stainless steel deck screws for wooden terraces. DTU 51.2 (extract available on our website).

JOISTS AND UNDERSTRUCTURE WOOD

Dimensions:

60mm x 40mm, length from 2m to 6m
 45mm x 70/95/120/145/170mm, length from 2m to 6m
 70mm x 145/170/195/220mm, length from 2m to 6m
 95mm x 190/195mm, length from 2m to 6m
 Other lengths and sections on request.

Application:

Thanks to the high quality of sawing and planning, you can use these joists and structural wood for multiple purposes (framework, cladding, terrace, pergola, carports ,...).

Section:

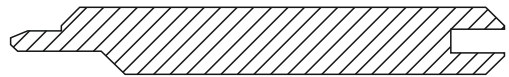

Surfaced four sides, rounded, quality A/B

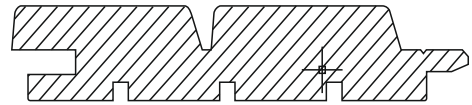

CLADDING

Dimensions: 21mm x 132mm useful (147mm actual), length from 2.4m to 4m
27mm x 125mm useful (147mm actual), length from 2.4m to 4m
End grooving up to 4m

Packaging: 104 pcs/pack

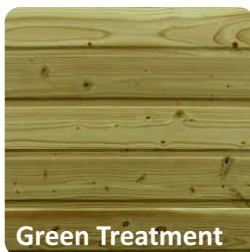

Reminder of the DTU: The cladding boards must be laid at a humidity of about 20% (extract available on our website)

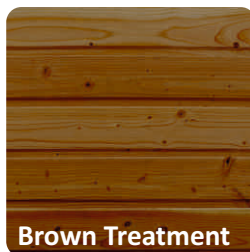

Application: Several types of installations are possible for your cladding: the American-style horizontal installation, the Scandinavian vertical installation or the oblique installation.

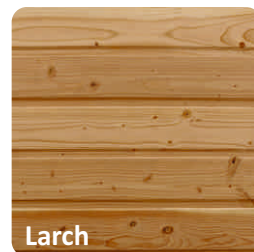

Whatever the type of installation you are considering, care must be taken that the cladding is well ventilated (low, median, high). To that end, place the cladding at a sufficient distance from the wall and 20 cm from the ground to avoid moisture rising that causes the material to degrade, with 2-4 m clear space for humid air evacuation.
Quality A/B.

Green Treatment

Brown Treatment

Larch

GARDEN SLEEPERS

Treatment: (*) autoclave class 4, green or brown certified

Dimensions: thickness: 100/120/140mm
width: 200/220/240mm
length: 2000/2400/2600mm

Characteristics: FSC label. We offer sleepers with flakes or sharp edges.

Packaging: 12 - 15 sleepers per pack.

Profile: Untreated, possibility of planing.

(*) Autoclave treatment: see page 24

CLOSING KIT 'LUXE'

Dimensions:

Post free of heart up to 3m (A), (B) and (C):

70 mm x 70 mm

90 mm x 90 mm

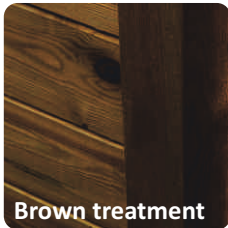

90 mm x 45 mm

Length from 1.5 m to 3 m

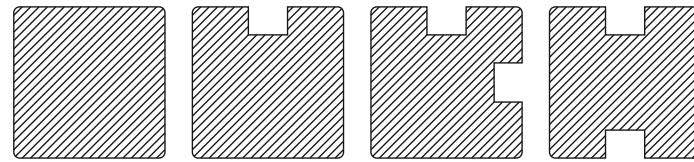

Can be grooved on demand: 22 mm, 28 mm, 32 mm, 36 mm

Green treatment

Brown treatment

Interlocking blade (D):

21 x 135 mm useful (147 mm actual), 104 pcs/pack

27 x 135 mm useful (147 mm actual), 104 pcs/pack

31 x 135 mm useful (147 mm actual), 104 pcs/pack

34 x 135 mm useful (147 mm actual), 104 pcs/pack

Length 2 m, others on request.

Straight finish plank (E):

21 x 120 mm, 104 pcs/pack

27 x 120 mm, 104 pcs/pack

31 x 120 mm, 104 pcs/pack

34 x 120 mm, 104 pcs/pack

Length 2 m, others on request.

Curved finish plank (F):

21 x 60/120 mm, 104 pcs/pack

27 x 60/120 mm, 104 pcs/pack

Length 2 m, others on request.

ECO-ANCHORS

Application:

The fixing of posts is extremely important as they provide rigidity for the whole structure. Anchoring posts is made easy by the various fence post supports. There are several types of these depending on the post section, the ground for the anchor, the required height above the ground, etc.

The entire load of the structure is transferred back to the ground via posts and their connectors, which is why it is very important their proper fixing to the base. Fence post supports not only provide stability and safety of the structure, but also transfer loads to the ground. Better stability is ensured when support legs are used.

The choice of the fence post supports depends on the type of base. They can be set in concrete or just in the ground. We offer the world's first composite anchor made of recycled PET bottles. The structure is further modified by chemicals and reinforced with fibreglass.

Characteristics:

- 100% recyclable PET / PC * material, graphite color
- Higher quality than anchors made from galvanized sheet steel
- Safe installation (no sharp edges)
- Better mechanical resistance than galvanized sheet steel supports
- Rain, snow, ice resistant
- They do not require maintenance or protection against the harmful effects of the external environment (corrosion, impregnation fungi, etc.),
- By choosing the eco-anchor we protect the natural environment
- European producer

* PET / PC: Polyethylene terephthalate / Polycarbonate

For the environment: Recycling of PET bottles reduces the impact on the environment!

- The sustainability of PET products reduces the emission of CO2
- The product does not release paint components or zinc into the soil
- No rust!

Service life guarantee: 10 years

Innovative composite material reinforced with glass fiber in order to improve flexibility and durability. 100% rain, snow, ice resistant.

Building elements allowing deletion and absorption of impacts.

Reinforced walls and screw holes.

Milling and reinforcements.

Water drainage groove.

Mechanical resistance of PET anchors

Mechanical Behavior of Anchors

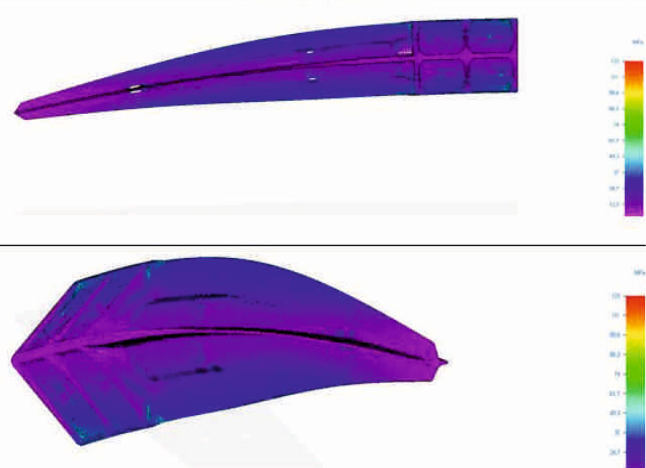

Type of analysis: pressure according to the von Mises plasticity criteria

Steel Anchors to sink

The steel anchor contains large areas of pressure concentration (purple color). This can cause cracks in the welds.

Eco-anchors PET

There is no such risk for the PET anchor because thanks to its unique shape, the tension zones are distributed over the entire length, which provides the best mechanical strength.

Green treatment

Brown treatment

Possibility of drilling on request

Packaging:

Diameter	5	6	7	8	10	12	14
No. of pieces/packs	360	240	182	132	90	56	42

Indicative only

Applications:

Logs in autoclave wood (*) for vegetable garden borders, garden borders or animal pens. Thanks to their class 4 treatment, the autoclave logs and semi-logs resist external attacks (insects, fungi, bad weather) and can be placed in direct contact with the ground.

(*) Autoclave treatment: see page 24

ORCHARD AND VINEYARD TRELLISING

Dimensions: 4/6 mm, 5/7 mm, 6/8 mm, 7/9 mm, 8/10 mm, 10/12 mm, 12/14 mm, 14/16 mm

Advantages: Our products are packaged with slats between each row: the space so created allows a homogeneous distribution of the impregnation and guarantees a significantly increased longer service life. A dry stake at the moment of its use increases its life span.

AUTOCLAVE TREATMENT

- Definition:** The preservative (odorless and aqueous) is injected under pressure (about 8 bars) into wood, thus protecting it in a sustainable way against rot and damage caused by xylophagous insects.
- Application:** This process is recommended for native conifers (fir, spruce, pine, etc.), which are not sufficiently resistant to rot, fungi and wood-eating insects attacks for outdoor use.
Class 4: in contact with the earth or fresh water, for example poles and palisades, avalanche barriers, stabilization structures, utility poles, playgrounds, pontoons or on-shore constructions.
Class 3: no-contact with the ground, for example facades, noise barriers, visual protection walls, balconies or terraces.
- Protection effects:** The autoclave wood has a life three to five times longer than untreated wood.
- Color:** After oxidation and fixation, the wood takes on a slightly green or brown color. The brown hue is obtained by the addition of a coloring paste. It is not a question of covering layer, but of a limited duration hue.
The color after the impregnation depends on the salt, the structure of the surface, the depth of penetration of the product as well as the quality of the wood. There is no guaranteed long-term color stability or color uniformity.
- Products used:** Tanalith E (Lonza Group Ltd.)
Korasit CC (Kurt Obermeider GmbH & Co. KG)
Wolmanit CX-10 (Dr. Wolman GmbH, BASF Group)
- Storage:** The impregnated wood must be stored under roof protected from dust and dirt and be well ventilated.

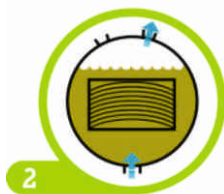

THE CYCLE OF TREATMENT

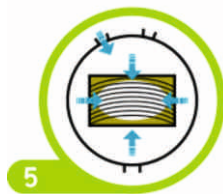

Step 1: Suitably prepared and dried, wood is loaded into the processing cylinder. Application of an initial vacuum, the wood cells are drained from air. The vacuum is maintained.

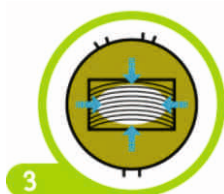

Step 4: The final vacuum extracts the excess product solution, which returns to the storage tank.

Step 2: Filling of the vacuum cylinder with the wood treatment product, a brown additive is added if necessary.

Step 5: The air enters the cylinder to complete the treatment cycle.

Step 3: Hydraulic pressure is applied, forcing the deep impregnation of the preservative product into the wood cells.

WOOD APPEARANCE CLASSES (CTB)

TEESOURCING sells only A / B choice

Wood appearance	A	B	A/B
Slots	Light non-crossing cracks allowed	Non-traversing cracks allowed	The A / B choices comprise at least 50% of choice A and 50% of choice B
Healthy knots	Allowed	Allowed	
Black knots	Max. diameters 1/4 of the width of view	Diameters max. 1/3 of width of view	
Jump knots	Not allowed	Diameter 15 mm allowed, distance min. between knots 1.5m	
Wood core trace	Light wood core traces admitted on facing	Healthy wood core trace allowed on facing	
Resin pocket	Small pockets allowed max. length 20mm	Small pockets allowed max. length 40mm	
Insect bites	Not allowed	Small black bites allowed	
Lack of planing	Allowed on anti-facing only	Allowed in anti-facing	
Planing appearance	Slight fuzz allowed (against the grain)	Slight fuzz allowed (against the grain)	
Tolerances of machining sides	8 / 10th of the allowed thickness. On the other sides: within the tolerances of a good technical quality		

The aesthetic appearance and the colour of the wood are not defects.
Do not store in an unventilated area because this may cause surface mould.

WOODEN BATTEN

Our products are packaged with slats between each row: the space so created allows a homogeneous distribution of the impregnation and guarantees a significantly increased longer service life. A rapid return to 20% wood humidity, corresponding to the DTU for the installation of planed autoclave wood, avoids white fungi occurrences on wood or wood warming. Autoclave treated wood should be stored in a ventilated place.

COEFFICIENTS OF SHRINKAGE

Linear shrinkage coefficients:

Wood essence	Coefficient - tangential direction
Ash	0,360
Poplar	0,243
Beech	0,340
Fir	0,310
Oak	0,300
SCOTS PINE	0,340

Excerpt from Mr. Petipas' work.
Comparative Technology of Wood Industries.

Example:

Planed terrace board at 25% moisture content
27x145 mm

1. Humidity regularly reaches 11% during the summer or the winter:

$$0,145 - ((25-11)*0,145*0,34/100) = 0,138$$

The board will be only 138 mm wide

2. Humidity reaches up to 30% in autumn and spring:

$$0,145 - ((25-30)*0,145*0,34/100) = 0,147$$

The board will be 147 mm wide.

WOOD, A LIVING MATERIAL

SALT RISE: During autoclave impregnation treatment, the treatment "salts" can reveal small green spots on the surface of the wood. These are resin risings that have been colored by the treatment product. This has absolutely no consequence for the wood.

GREYNESS: Greyness is a natural phenomenon. It results from the "washing out" of the product under the action of the sun's UV rays. It can be avoided by covering the product, before laying, with a stain, a wood paint, or a varnish. The goal is to obtain a UV filtration.

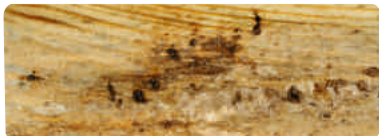

CRACKS AND SPLITS: When drying, wood works irregularly depending on its variable density. The external elements (temperature, air humidity, sunshine ...) are elements that act on the drying which results in cracks. These do not alter in any case the mechanical resistance of the product or its static properties.

DIFFERENCE OF SHADE, OF COLOR: Each tree is unique and each tree has different shapes and veins. The treatment will penetrate differently each layer of wood density, resulting in different coloring effects. They fade quickly during outdoor exposure.

MOULD: During very hot weather, dark spots can be seen on the rougher parts of the wood, called darkening. They are microscopic fungi that do not destroy the wood and not affect its resistance. This phenomenon, which appears especially during storage with insufficient ventilation, can disappear by itself (under the action of rain, sun and wind) or be wiped off with a cloth.

THE RESIN: During the autoclave treatment of resiniferous trees (fir, Scots pine, spruce, ...) the pressure can bring to the surface a little resin. Simply remove with a spatula or turpentine.

THE KNOT: The products are made from wood which, of course, have branches. The number of nodes varies. They do not constitute a quality defect in the garden wood field.

AGAINST THE GRAIN: Against the grain appears when, planing the wooden batten, in some areas the against the grain has a different inclination than that of the neighboring parts, often around the knots. This phenomenon is not related to the quality of the planing, but to the structure of the wood.

MILLING: We talk about milling when a piece of irregular round wood is passed through a milling machine to give it a constant diameter along its entire length. Blunting the posts (to do a point to put them in the ground more easily) is not systematic and depends on the technical possibility of realization.

WOOD CORE : The wood core constitutes the central part of the trunk. It is also called the „marrow". It is a set of spongy tissues softer than the other internal parts of the wood (heartwood and sapwood). The heart does not prevent the good behavior of the wood.

ACACIA OUTDOOR

Acacia is a wood with exceptional natural qualities which make its use very interesting. This is why we decided to offer you the whole range of products of this robust wood species.

Species: Acacia (actually black locust or "false acacia")

Characteristics: Yellow-green to golden brown wood, taking another hue under the action of the weather and UV. Alternative to tropical woods, acacia is the only European hardwood used in risk class 4 without any treatment - life span of 20 years in contact with the ground.

Technical characteristics (dry at +/- 14%):

- Density: 770 kg / m³

- Impact resistance, resistance to bending: 7.4 J / cm²

Origin: Hungary, 1st acacia forest in Europe, poor soil, very sandy, extreme climate (30 ° in summer and down to -20 ° in winter) -> this gives this specific species great resistance and durability.

Application: It is an ideal species for all exterior works thanks to its natural solidity and stability in time. Terrace decking, 1/2 stakes and peeled stakes, stakes and square posts, posts polygonal, fence roll... the acacia adapts to all terrains with a natural appearance and a perfect integration in the landscape.

Acacia stakes and half-stakes

Comments: Sale only by full truck mixed with other acacia products

Sale by pallet

Pointed or unpointed

Possibility of manufacturing sawn half-logs

Also available unpeeled

ACACIA TERRACE DECKING

Planed section: 22 x 100 – 22 x 120 mm **Profile:**

Length: 1.00 – 1.50 – 2.00 m

Acacia / Robinia terrace decking, planed on all four sides. Ideal for making outdoor terraces. A sustainable alternative to exotic wood.

In order to optimize the machining of wood, we offer a mix of terrace boards in 1m, 1.5m and 2m.

Before machining, the raw boards are dried in a natural way, in the open air, to be then finished in a dryer. A moisture content of around 18%, ideal for outdoor use - guarantees dimensional stability for a long time.

ACACIA FENCE ROLL

The Acacia Fence Roll is the most resistant on the market (Class 4 naturally, Chestnut and Hazelnut class 3). The stakes are split so as not to damage the wood fiber and are connected with a galvanized steel wire so that your fence remains a decorative element of your environment for a long time.

Stakes height: 100 - 120 - 150 cm

Dimension of the pointed end: 5-6 cm

Perimeter of the stakes: 9-13 cm (+/- 1 cm)

Spacing: 6-8 cm

ACACIA POLYGONAL STAKES

Polygonal stakes split in the direction of the wood have better resistance than square stakes.

Perimeter: 20.5-23 / 23.5-26 cm

Length: 1.50 – 1.80 – 2.00 - 2.20 m

ACACIA ROUND POLES

Our untreated and naturally durable acacia round poles are an alternative to pine treated in class 4.

The absence of acacia impregnation makes it a real sustainable alternative.

This wood is suitable for exterior works and can be subjected to permanent exposure to the weather.

Applications:

-The gardens: fences, portico

-Public facilities: chainage markers, fitness trail, children's games, retaining structures, motorway edges, signage

JARDIN & PLAISIR

The hazelnut tree, a robust tree with a dense and upright branching, reaching a height of 15 meters, also called *Corylus avellana* (the scientific name), would be one of the rare species of the secondary era (- 70 million years) to have survived to the present day.

Hazelnut is an excellent substitute for chestnut wood which is popular in the Occident. The biological properties of the two trees are sufficiently similar in order that the hazel wood successfully replace the expected characteristics of the chestnut wood.

Split hazelnut fences are a great natural way to fence off the plot and garden. The wire connecting the individual slats is made of galvanized steel wire, which ensures very good weather resistance.

The hazelnut tree is completely natural, it does not contain chemicals, which makes it safe for the environment.

The hazelnut fence does not require any impregnation. The structure of hazel wood contains acids, tannins and natural resins. They provide an excellent natural and lasting protective barrier against changing weather conditions for many years, thus slowing down the aging process of the wood.

Hazel panels, with their visual appeal, blend perfectly with the natural decor of your garden. The wood, braided by hand, comes from coppice: a method which provides very flexible stems and which encourages sustainable development by allowing rapid regeneration.

The hazel and the willow are very easily cultivable trees with very fast growth.

Natural and untreated

Willow:

The willow fiber is actually a young willow shoot, cut in winter and used after drying (natural drying of two or three months). Its size varies from 60 cm to more than 2m60, with more or less thick stems. They are immersed in a bath to make them more flexible but also more resistant once dry. When this process is completed, then the branches are shaped to become furniture.

Willow is very popular thanks to:

- its great resistance: a willow basket can transport large quantities of materials without cracking;
- its robustness in the case of cuts or shears;
- its resistance to rotting, it does not rot, just like rattan;
- its affordable cost and the low maintenance it requires;
- its water resistance: it does not swell and does not deform, even when is very humid.

Advantages:

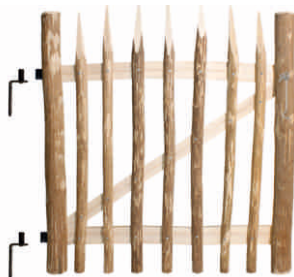

Willow is a very flexible, thin and light material that can be easily handled. It is very simple to braid, which allows many possibilities of patterns. This fiber is available in different natural colors (green, red, brown, black, white ...), in several sizes (length and diameter) and can easily be dyed. Thus, willow is the plant fiber most often used to make furniture with original backs and design; while retaining a natural appearance. It is also used for many small objects and especially for baskets.

Willow furniture is generally much cheaper than rattan or kuba furniture and easier to find. Maintenance is as simple as for other natural fiber materials.

Willow brings a refined and sophisticated touch to a piece of furniture that can be used for a bedroom, garden or living room.
